

Mycelia — UI Design Brief

This document briefs UI/UX designers on the visual design and motion specs for Mycelia. Mycelia is a cozy mushroom-cultivation Roblox game in the Bee Swarm Simulator longevity lineage. The UI is the player's primary point of interaction — every economic decision, every recipe discovery, every social interaction goes through a panel you'll design. UI quality is a primary retention lever.

What you deliver: visual mockups (Figma / Photoshop / Sketch — your tool of choice), a color/typography spec doc, exported asset PNGs at the resolutions specified per screen, a motion spec describing transition timing + easing curves, and an accessibility audit. The scripter then wires your designs into Roblox UI primitives.

What you do NOT deliver: Roblox UI implementation code (Frame, TextButton, UICorner, UIPadding instances), animation scripts, or data binding logic. Those are scripter scope — a separate brief.

Project context

Mycelia targets ages 9-16 primarily but designed to retain players into adulthood. Mobile is the primary platform (60%+ of Roblox playtime is mobile). Desktop and console are secondary but must work.

Player session structure: 5-15 minutes for casual sessions, 60+ minutes for engaged players. Daily check-in habit is the design goal. UI must be approachable enough for a 5-min player to accomplish a task without confusion AND deep enough for a 60-min player to feel they're navigating real complexity (potion recipes, trade economics, spirit collection, biome unlocks).

Visual direction

Cozy, hand-painted, slightly desaturated. Think Stardew Valley's UI but designed for Roblox mobile screens. Warmth + readability + a consistent illustrated quality across every panel. UI must NOT feel like a generic Roblox shop interface — that's the bar to clear.

Locked-in design rules across all UI surfaces:

- Cozy color palette (see Colors section). Cream backgrounds, warm earth-toned accents, soft greens. Avoid pure white, pure black, oversaturated primaries.
- Hand-painted illustration style on all icons + panel art. NOT flat / Material Design / iOS system icons. The visual should feel like a children's book illustration.
- Rounded corners (UICorner radius 8-16px depending on element size). No sharp 90-degree edges anywhere except very intentional accents.
- Soft shadows / glows under panels and buttons. Subtle drop-shadow with high blur, low opacity. Panels feel like they're floating gently above the world, not stamped on top.
- Typography: warm sans-serif for body (Gotham family or similar — reads well at small sizes), serif accent for titles (e.g., Lora, Merriweather). NEVER Comic Sans or Papyrus.

- Iconography: line-art with subtle fills, not solid silhouettes. A mushroom icon should feel like a sketch with color washes, not a logo.
- Mobile-first sizing. 44pt minimum tap target. 16pt minimum body text. Single-thumb reach: most-used controls go in the bottom 60% of the screen.
- Motion is gentle. No bouncing, no flashing, no rapid color shifts. Tweens use ease-out curves; durations 150-300ms. Reduced-motion mode disables all non-essential animation.

Reference aesthetics

- Stardew Valley — UI panels, color palette, font choice.
- Animal Crossing: New Horizons — soft UI, warm accents, mobile-friendly readability.
- Bee Swarm Simulator — for understanding what works at Roblox mobile thumbnail scale.
- Adopt Me! — for the cozy + kid-friendly tone without being saccharine.
- Children's book illustration aesthetic in general (Quentin Blake-ish, Beatrix Potter-ish) for icon style.

Mobile-first design rules — non-negotiable

- Every interactive element $\geq 44 \times 44$ pt tap target. This is iOS HIG and Material Design's shared rule for thumbs.
- Test every screen on a 6.1-inch reference device (iPhone 15 / Pixel 8 size) before sign-off. If a desktop user can read a panel but a phone user squints, redesign.
- Bottom-heavy layouts. Critical actions in the bottom 60% of the screen, where the thumb naturally rests. Top of screen = passive info (notifications, status), not actions.
- Modals fill 85-92% of screen width on mobile (vs ~50% on desktop). Use UIScale or AspectRatio constraints so the design adapts.
- Text contrast: minimum 4.5:1 (WCAG AA) for body text on cards, 3:1 for large text. Pre-validate with a contrast checker before exporting.
- Avoid hover-only affordances. Mobile has no hover. Long-press is acceptable as a secondary interaction.
- Avoid horizontal swipe gestures for navigation; the right-edge of mobile screens is a system back gesture on iOS and Android. Use bottom buttons instead.
- Account for the notch / Dynamic Island / Roblox topbar. The Roblox topbar reserves the top ~36px of screen space. Your designs should sit BELOW that bar.

Color palette

Locked-in core palette. Designers may extend with shades + tints but must not introduce new hue families without a discussion.

Token	Use	Hex	Notes
bg-card-warm	Default panel background	#F8F1E4	Cream; never pure white
bg-card-deep	Modal overlay panels (elevated)	#EFE5D2	Slightly deeper cream
bg-card-dark	Trading UI / serious moments	#2E2A26	Dark warm brown
bg-overlay	Behind modal (full-screen dim)	#0E0C09 @ 65% alpha	Dark, never pure black
text-primary	Body text on warm cards	#3A2E22	Warm dark brown
text-secondary	Hints / captions on cards	#7A6753	Mid warm grey
text-on-dark	Body on dark cards	#F4ECDA	Cream on brown
accent-moss	Primary action / CTA buttons	#6E9A4F	Warm moss green
accent-amber	Discovery / reward / highlight	#D9A23B	Honey amber
accent-coral	Destructive / warning	#C66E5C	Soft warm coral
accent-violet	Brewing / magical / potions	#7C5BA0	Muted purple
accent-teal	Water / koi / cool moments	#4F8C8C	Soft teal
tier-common	Common rarity dot	#C9C9C9	Cool grey
tier-uncommon	Uncommon rarity dot	#7AC97F	Soft green
tier-rare	Rare rarity dot	#5099D8	Soft blue
tier-epic	Epic rarity dot	#A266CC	Soft violet
tier-legendary	Legendary rarity dot	#E6B23A	Warm gold
tier-mythic	Mythic rarity dot	#E55895	Warm pink

Typography

- **Headline serif:** Lora Bold (or similar warm serif). Use for modal titles, hero text on cards. 18-24pt range.
- **Body sans-serif:** Gotham Medium (Roblox Studio's GothamMedium font is the default family — use it). 14-18pt range.
- **Body italic:** Gotham MediumItalic. Use for hints / flavor text / captions.
- **Numerics:** Gotham Bold for emphasis on coin counts, inventory totals, etc. Same family for visual cohesion.
- Use no more than 3 distinct font sizes within any single panel. Hierarchy comes from weight + color, not multiplied size.
- **Line height:** 1.4x for body text minimum. Cozy reading needs space.

Component library — atoms

Reusable components used across multiple screens. Designer ships ONE definitive version of each; the scripter implements once and reuses. Variant states (default / hover / active / disabled) provided for each.

Buttons

- Primary CTA — accent-moss background, text-on-dark text. Used for confirm / submit actions. ~120-160px wide × 44px tall, rounded 8px corners. Default state slightly elevated; pressed state slightly recessed.
- Secondary — bg-card-deep background, text-primary text. Used for cancel / less-emphasized actions. Same dimensions.
- Tertiary / link — text-only with text-primary color, underline on hover. No background. For 'forgot something?' style optional actions.
- Destructive — accent-coral background, text-on-dark text. For drop-item / leave-faction / delete confirmations.
- Disabled state — 40% opacity overlay, no hover effect, cursor reverts to default.
- Toggle button — pill-shape, accent-moss when active, bg-card-deep when inactive. Used for filter chips, settings toggles.

Cards

- Item card — bg-card-warm background, ~80×80px to ~120×120px depending on grid density. Corner radius 8px. Soft drop shadow. Holds a thumbnail icon + small label.
- List row — full-width within parent panel, ~56-72px tall. Bg-card-warm with 1px bottom border in a slightly deeper warm tone for separation.
- Hero card — bg-card-warm, ~360×120px. Used for currently-tracked-quest, featured spirit, or active effect at top of HUD.
- Empty-state card — same bg as item card but text-secondary text in italic, e.g., 'No mushrooms in inventory. Harvest some to start brewing.'

Modals + overlays

- Modal panel — centered card on top of bg-overlay. ~85% screen width on mobile, ~480px max width on desktop. Has a title bar at the top with a close X.
- Bottom sheet — alternative modal style for mobile only. Slides up from bottom; covers ~70% screen height. Used for pickers (Plant species, Brew ingredients, etc.) where a centered modal would feel intrusive.
- Toast — small floating notification, ~280×56px, anchored top-center. Slides in from above, auto-dismisses after 3-5s.

- Tooltip — small caption-style overlay attached to a hovered/long-pressed item. Shows item name + 1-line description. Bg-card-dark with text-on-dark text.

Chips + tags

- Active effect chip — small pill-shape (~120-180×28px), accent-themed (blue for speed, green for growth, orange for wild yield, etc.). Has icon + name + countdown timer.
- Rarity dot — small (12px) circle, color from tier palette. Inline with item names anywhere in the UI.
- Filter chip — toggle pill (~80×32px), accent-moss when active.
- Status badge — small (~44×20px) rectangle anchored to a card corner. Used for 'NEW!' on undiscovered species, 'x99' on stack counts, etc.

HUD — always-visible UI

The HUD is the player's persistent control surface. It must NOT obscure the world; design panels that hug the screen edges and leave the central viewing area free.

Top-left stack (information)

- Stats card (top): Coins count + Inventory total. Hero card style. ~200×70px. Coin icon + number, then below it inventory icon + number.
- Action button row (below stats): horizontal row of 5-6 round icon buttons (Backpack, Pokedex, Brewing Journal, Quests, Trading, Shop, Settings). ~44×44px each, 8px gaps. Each is a tappable button that opens its respective modal.
- Active effects strip (below buttons): vertical stack of active effect chips. Maximum 5 visible (overflow scrolls).

Top-right stack (notifications)

- Tracked quest widget: pinned objective summary. ~280×80px hero card. Shows quest name + objective progress (e.g., '3/5 Brown Caps harvested') + small XP indicator. Tappable to open Quest Journal.
- Notification toast stack: when toasts appear, they stack vertically below the tracked quest. Each toast is a small card with a brief icon + message.

Bottom-center (mobile only)

- Mobile control overlay: jump button + action button. Roblox's default mobile controls — designer reviews defaults but doesn't replace them.

Bottom-right

- Chat bubble icon: small (~44×44px) chat icon. Tappable to open chat. Roblox's default chat works; designer styles the icon to match Mycelia palette.

Per-screen specifications

1. Backpack / Inventory

Browse and manage all items the player owns. The most-opened panel in the game — design for fast scanning + recognition.

Layout:

- Tab strip at top (horizontal): All / Mushrooms / Potions / Spores / Substrates / Additives / Recipes / Spirit Items / Cosmetics / Tools / Quest. 11 tabs total. Use scrolling tab strip on mobile (tabs slide horizontally with momentum).
- Filter bar (below tabs): toggle chips for Common / Uncommon / Rare / Epic + a sort dropdown (by name / by rarity / by recently obtained / by sell value).
- Grid: $4 \times 8 = 32$ slots default per category. Each slot is an item card (~80×80px) with thumbnail + count badge in the corner if stack > 1. Empty slots are visible (bg-card-warm with 50% opacity).
- Slot interactions: short-tap shows tooltip with name + description; long-press opens action menu (Drop / Use / Trade / Inspect).
- Bottom: stack overflow indicator if > 32 of a category exist (e.g., '47 / 32 — Inventory full!'). Inventory expansion gamepass ad below if applicable.

Mobile-specific: tabs scroll horizontally with momentum + snap. Grid slot size shrinks to 4×6 on small screens to keep tap targets $\geq 44\text{pt}$.

2. Pokedex (mushroom collection)

Browseable catalog of all 60 launch species. Discovered species show full info; undiscovered show as silhouettes.

Layout:

- Header: 'Discovered: X / 60' counter prominently. Progress bar visualizing fraction.
- Filter row (below header): All / Common / Uncommon / Rare / Epic / Legendary / Mythic / Seasonal. Same chip style as backpack.
- Sort dropdown: by tier / by name / by recently discovered / by sell price.
- Card grid: each species is a square card (~120×120px) with thumbnail + name + tier dot. Discovered species: full-color thumbnail. Undiscovered: silhouette in tier color, name shown as '???'.
 - Tap a card to open detail view: large thumbnail, full description, sell price, where to find (biome / substrate hints), known recipes that use it.

3. Brewing Journal (potion catalog)

Same shape as Pokedex but for potions (20 launch potions).

- Header: 'Discovered: X / 20' counter.
- Filter row: All / Buffs / Tools / Cosmetic / Forest Interaction.
- Card grid: ~120×120 per potion card. Discovered: full info (name, rarity dot, effect summary, owned count). Undiscovered: '???' with tier dot if hinted (e.g., 'You've heard rumors of a Common-tier potion brewed from BrownCap...').
- Tap a card to open detail view: name, description, effect (e.g., 'Walk speed +30% for 30s'), owned count, recipes that produce it (only if Settings.showPotionHints = true).

4. Brewing UI (cauldron picker)

Triggered when player presses E at the cauldron. The most interactive panel — design for speed of repeated use.

- Title bar: 'Cauldron' + close X.
- Method buttons row (top): 4 buttons — Steep / Boil / Ferment / Dry-grind. Mutually exclusive selection (only one active at a time). Selected = accent-moss highlighted; unselected = bg-card-deep.
- Ingredient list (scrolling middle): one row per mushroom species the player owns. Each row shows tier color dot + species name + 'inv 5 / picked 2' counter on the right.
- Tap a row to add 1 ingredient (counter increments). Tap a row already at max (inventory cap or 5 picked total) to clear back to 0.
- Selected ingredients summary (below ingredient list): horizontal display of picked ingredients. e.g., 'BrownCap × 3, FairyCup × 1'.
- Bottom: Brew button (accent-moss, prominent) + Cancel button. Brew is greyed out until method is selected and ≥ 1 ingredient picked.
- Recent brews mini-strip (top, optional): last 3 brews with their results. Helps players remember what they've tried.

5. Plant picker

Triggered when player presses E at an empty plot.

- Title bar: 'Plant a Spore Patch' + close X.
- Filter chips: All / by tier / by substrate compatibility (with this plot's current substrate).
- Species list (scrolling): each row shows tier dot + species name + plant cost (in coins) + small icon indicating substrate compatibility (green check / yellow warning / red X). Greyed-out rows for species the player can't afford or hasn't discovered.
- Plot info card (top): shows the plot's current substrate, moisture, light, host tree, pH. Player can change substrate from here (consumes a substrate item from inventory).

- Bottom: Plant button (accent-moss) — disabled until a species is selected.

6. Potion drawer (consume picker)

Triggered by tapping the Potions HUD button.

- Title bar: 'My Potions' + close X.
- Tab row: 'Active' (potions currently affecting you) / 'Inventory' (potions you own).
- List rows: name + tier dot + effect summary + owned count + tap-to-consume button. Inert potions (no effect) appear greyed-out with 'No effect yet' label.
- Active tab: shows currently-running effects with countdown timer. Tap to see details.

7. Active Effects strip (HUD chip stack)

Lives in the top-left HUD stack. Shows currently-active timed effects from potions + spirit bonuses (and future weather buffs).

- Vertical stack of chips, max 5 visible (overflow scrolls).
- Each chip: icon + name + countdown ('Speed 1.3× — 0:24'). Color-coded by effect kind.
- Permanent (untimed) bonuses from spirits: shown without countdown, indicated by a small pin icon.

8. Toast notification system

- All toasts: ~280×56px floating cards, top-center anchored. Slide in from above (200ms ease-out), hold for 3-5s, fade out (300ms).
- Toast types — design distinct visual styles:
 - Discovery toast (potion / species / spirit) — amber accent. Title 'Discovered:' + item name. Plays a brief sound.
 - Reward toast (coins / item gained) — moss accent. '+25 coins'. Subtle.
 - Negative toast (brew fizzled / inventory full) — coral accent. Brief one-line message.
 - Quest progress toast — teal accent. Quest name + objective tick (e.g., '3/5 → 4/5').
 - Stacking: when multiple toasts fire in quick succession, they queue vertically below the tracked-quest widget. Max 4 visible at once; older ones fade out faster to make room.

9. Settings menu

- Modal layout: tabs on left for Audio / Display / Accessibility / Account / About.
- Audio tab: master/music/SFX/ambient sliders (0-100%); Mute When Tabbed Out toggle.
- Display tab: graphics quality preset (Auto / Low / Med / High); camera sensitivity slider; UI scale slider.

- Accessibility tab: Reduced Motion toggle; Color-Blind Friendly Mode dropdown (Off / Protanopia / Deuteranopia / Tritanopia); large-text toggle; high-contrast mode.
- Account tab: hut access level (Private / Friends Only / Public); sign-out (placeholder for now).
- About tab: game version, credits, support links.

10. Shop UI (used by all merchants)

One shared component. Each merchant configures it via data — what they buy + what they sell + price modifiers. Designer ships ONE shop panel design that adapts to each merchant's inventory.

- Header: NPC portrait + greeting line (e.g., 'Welcome back, traveler.').
- Tab strip: Sell / Buy.
- Sell tab: list of player's inventory items the merchant accepts, with per-item sell price and +/- quantity selector. 'Sell All' / 'Sell Selected' buttons at the bottom + total payout summary.
- Buy tab: merchant's inventory with prices and +/- quantity selector. Cards show name + thumbnail + price + Buy button. Greyed out if player can't afford.
- Top-right corner: player's current coin balance + inventory space remaining.
- Each merchant variant changes only the portrait + greeting + which items appear; the panel structure stays identical.

11. Trading UI (player-to-player)

Two players see synchronized panels. The most spec-sensitive UI in the game — clarity here prevents player confusion that becomes support tickets and trust issues.

- Layout (centered modal, ~92% screen width):
- Left column — my backpack (categorized, scrollable). Tap an item to move it to my offering slot.
- Center top — my offering area: $2 \times 5 = 10$ item slots + coin offering input box (digit-only).
- Center middle — city tax indicator showing % cut (default 5%, adjustable in Constants). Visible to both players.
- Center bottom — their offering area (read-only): 2×5 slots + their coin offering displayed.
- Right column — their backpack (read-only — I can see what they have but can't touch).
- Bottom: Offer / Accept / Deny buttons. Button label changes based on state:
- Initial: 'Offer'
- Waiting for other player: 'Waiting...' (greyed)
- After both offered: 'Accept'
- Waiting for other player to accept: 'Waiting...' (greyed)
- Anti-confusion notes: when their offer changes, briefly highlight the changed slot so I notice. Show 'Trade pending' state clearly. Failed-trade messages must explain WHY it failed (distance, decline, disconnect).

12. Travel UI

Triggered when talking to the Travel Coordinator NPC.

- Modal: 'Where to?' header + 7 biome cards (one per biome).
- Each biome card: hero illustration (biome-themed art) + name + brief description + travel cost + status badge.
- Status badges: 'Locked' (grey) with requirement / 'Unlocked' (default) / 'You are here' (highlighted with accent-moss ring).
- Locked biomes are visible (greyed 50%) so players see what's ahead.
- Tap an unlocked biome → confirm prompt: 'Travel to Misty Hollow? Your inventory comes with you. Travel cost: 25 coins.'

13. Player Stalls (rented shops)

Phase 2 feature. Players rent stalls in the Trading Post.

- Stall management modal: tabs for 'My Stall' (manage inventory + listings) / 'Visit Stalls' (browse other players').
- My Stall: list of items in stall + add/remove buttons + per-item price input + auction toggle (with min bid + duration).
- Visit Stalls: scrollable list of stalls owned by other players. Each card shows owner name + featured items.
- Tap a stall card → opens stall detail view with all listings + Buy buttons.

14. Quest Journal

- Tabs: Active / Completed / Available.
- Active tab: each quest is a card showing title + NPC + objective progress (with progress bar) + reward preview + 'Track' toggle.
- Completed tab: read-only history with date completed.
- Available tab: quests offered by NPCs the player can currently access. Each card shows the giving NPC + biome + brief description + 'Talk to ' hint.
- Tracked quest widget on HUD updates when a quest is set as tracked.

15. NPC Dialogue

Chat-bubble style at the bottom of the screen.

- Layout: bottom 30% of screen. NPC portrait on the left (~80×80px circular), text bubble on the right with their dialogue.
- Continue button (bottom-right) advances to the next line.
- Response options (when present): 2-4 buttons stacked vertically below the bubble. Each button is a player-perspective response.
- Close X (top-right) dismisses the dialogue (some critical lines lock the close until a response is chosen).

16. Player Profile

- Modal: player avatar + name at top. Below: stats grid (Total Renown / Mushrooms Discovered / Potions Brewed / Spirits Owned / Hours Played).
- Reputation breakdown: vertical list of NPCs with rep bars. Hover/tap an NPC to see their friendship tier.
- Achievement badges: grid of unlocked badges below stats.

17. Hut decoration UI (Phase 3)

- Triggered inside the player's hut by tapping a 'Decorate' HUD button.

- Bottom-sheet picker: tabs for furniture types (Wall / Floor / Tabletop / Hanging / Magic). Drag-and-drop or tap a category to filter.
- Tapping an unlocked decoration shows ghost preview that follows cursor; tap on a valid anchor to place.
- Long-press a placed decoration to remove (returns to inventory).
- Hut Settings sub-modal: change wall color, floor texture, lighting cycle, public/friends-only/private access.

Motion + animation spec

Motion is gentle, never alarming. Use these defaults across all UI; deviations require justification.

- Modal open: panel fades in (200ms) + scales from 95% to 100% (200ms ease-out). Overlay dims simultaneously (250ms).
- Modal close: reverse — scales to 95% + fades out (180ms). Overlay clears (220ms).
- Bottom sheet open: slides up from below (250ms ease-out). Close: slides down (200ms ease-in).
- Toast in: slides from above (200ms ease-out) + fades in (200ms).
- Toast out: fades out (300ms ease-in). No slide.
- Button hover (desktop): subtle lift (1-2px translateY) + slight color shift (100ms).
- Button press: brief depress (1px translateY) + color darken (80ms).
- Tab switch: content cross-fades between tabs (150ms).
- Discovery glow effect (when player discovers a new species/potion): card scales briefly to 105% and back (400ms ease-in-out) + accent-amber glow flashes around the border.
- Reduced motion mode: all of the above become instant (0ms duration). Color shifts still happen; only positional/scale animation is disabled.

Accessibility

- WCAG AA contrast minimum: 4.5:1 for body text, 3:1 for large text. Pre-validate all designs.
- Color-blind safe: never convey information by color alone. Rarity is shown with both color dot AND text label. Effect chips show icon + text + color.
- Reduced Motion: a Settings toggle that disables all positional/scale animation. Tween durations become 0; cross-fades become instant cuts.
- Large Text mode: optional Settings toggle that increases body text from 14pt → 18pt across all panels.
- High Contrast mode: optional alternative palette with greater contrast (cream → white, dark brown → black).
- Focus states (for keyboard navigation): clear 2px accent-moss outline on the currently-focused element. Important for desktop accessibility.

Deliverables expected

In rough priority order — earlier items unblock dependent design work.

#	Deliverable	Phase	Notes
1	Color + typography spec doc	Pre-Alpha (now)	Locked-in tokens, used by everything
2	Component library (atoms): buttons, cards, modals, etc.	Pre-Alpha (now)	Designer ships definitive variants of each
3	HUD layout mockup	Pre-Alpha (now)	All persistent UI elements
4	Backpack panel mockup	Phase 1	Most-opened panel; design for speed
5	Pokedex panel mockup	Phase 1	Card grid + filter chips
6	Brewing UI mockup (cauldron)	Phase 1	Method buttons + ingredient picker
7	Brewing Journal mockup	Phase 1	Card grid for potions
8	Plant picker mockup	Phase 1	Species selection + plot info card
9	Potion drawer mockup	Phase 1	Active vs Inventory tabs
10	Active effects chip designs (10 effect-kind variants)	Phase 1	Color-coded per kind
11	Toast system (4 variant styles)	Phase 1	Discovery / Reward / Negative / Quest progress
12	Settings menu mockup	Phase 1	Audio / Display / Accessibility / Account / About
13	Shop UI mockup (one shared design)	Phase 2	Used by all merchants via data config
14	Trading UI mockup	Phase 2	The most spec-sensitive panel
15	Travel UI mockup	Phase 1+	7 biome cards, locked + unlocked states
16	Player Stalls mockup	Phase 2	My Stall + Visit Stalls tabs
17	Quest Journal + tracked-quest widget	Phase 2	Active / Completed / Available tabs
18	NPC dialogue UI mockup	Phase 2	Chat-bubble + portrait + responses
19	Player Profile mockup	Phase 3	Stats grid + reputation breakdown
20	Hut decoration UI mockup	Phase 3	Bottom-sheet picker
21	Asset pack export (PNG / 9-slice)	Per-screen	@1x and @2x for mobile
22	Motion spec document	Phase 1	Tween durations, easing curves, per-screen
23	Accessibility audit report	Phase 3	Contrast, color-blind, reduced motion validation

File format expectations

- Mockups: Figma (preferred) or PSD / XD / Sketch. Designer chooses tool, ships exported PNGs alongside.
- Asset exports: PNG with transparent background, @1x AND @2x resolution. 9-slice exports (with stretch zones marked) for any element used at variable sizes — buttons, panels, scroll

bars.

- Color spec: shipped as a Figma-style file or a Markdown doc with hex values + named tokens.
- Motion spec: Markdown doc OR Figma annotations describing duration + easing for every transition.

Coordinating with the scripter

- The scripter implements your designs in Roblox UI primitives (Frame, ImageLabel, TextButton, UICorner, UIPadding, UICollectionLayout, etc.). They don't need vector math — they need pixel sizes and a clear hierarchy.
- Provide layouts as flat layer trees. Indicate parent-child relationships clearly. The scripter creates the hierarchy in code.
- Provide explicit pixel sizes for every element. Roblox UI uses UDim2 (Scale + Offset combinations); the scripter handles that conversion. You provide intent: 'this card is 280px wide, 80px tall, with 16px padding.'
- Provide explicit padding + spacing values. 'List items have 8px gap between them, 16px outer padding from container.' The scripter uses UICollectionLayout to enforce.
- Avoid CSS-only effects (gradients, blurs, complex shadows) — Roblox UI supports a subset. Provide bitmap fallbacks for anything Roblox can't natively render. Specifically: Roblox supports rounded corners (UICorner), gradients (UIGradient), strokes (UIStroke), simple shadows via stretched-image-with-shadow exports. Most other CSS effects need to be baked into PNG.
- Specify all states upfront: default, hover, active, pressed, disabled. The scripter wires these once you've defined them.
- When in doubt, draw it. A diagram or annotated screenshot saves an hour of back-and-forth.

Final notes for designers

- Mycelia targets a multi-year operational lifecycle. The UI you ship will be used by hundreds of thousands of players for years — invest in the craft.
- The cozy aesthetic is uncontested on Roblox right now. Don't drift toward the visual conventions of Bee Swarm Simulator (which is more bright/saturated) or Adopt Me (which leans iOS-Material). Mycelia's UI should look like a illustrated storybook, not a generic Roblox shop.
- Read the project's design doc at docs/DESIGN.md for broader vision.
- Read the SCRIPTING-ORDER.pdf for the gameplay systems your UI is wrapping. Understanding what each panel actually DOES helps you design panels that serve the gameplay rather than fight it.

- Read the [WORLD-DESIGN-BRIEF.pdf](#) for the world aesthetic — your UI should harmonize with it. Same warm-cream palette, same hand-painted feel. They're sister documents.
